Certified Person; Sampling –
*Continuous Personal Dust Monitors (CPDM)
Certification Examination Question Pool

* The term “Continuous Personal Dust Monitor” (CPDM) in this examination question pool is in reference to 30 CFR §74.2(d); the use of the term “PDM” is in reference to Thermo Fisher Scientific’s Personal Dust Monitor (Model PDM3700). The Model PDM3700 is currently the only CPDM approved by the Mine Safety and Health Administration (MSHA) and The National Institute for Occupational Safety and Health (NIOSH).
1. A _____________ is permitted to perform cleaning of the CPDM daily, after each use, or as necessary.
   a. person certified in maintenance and calibration for the CPDM
   b. mine official
   c. person certified in sampling for the CPDM
   d. both a. and c.

2. Cleaning the sample lines as specified by the manufacturer is required to be done daily or ____________.
   a. after each use
   b. annually
   c. monthly
   d. none of the above

3. The grit pot is required to be cleaned daily, after each use, or as necessary with ____________.
   a. canned air
   b. water
   c. an alcohol swab
   d. both a. and c.

4. The cyclone and inlet tubing are required to be cleaned __________ or as necessary.
   a. monthly
   b. daily
   c. weekly
   d. every 6 months

5. Prior to wearing a CPDM, the miner must be trained on ____________.
   a. how to display the information screens
   b. how to attach the CPDM to his body
   c. the meaning of information displayed by the CPDM
   d. all the above

6. ________ indicates the charge/status of the PDM battery.
   a. An LED light located on the front of the charging unit
   b. An internal clock in the unit
   c. The sound of the charger
   d. A battery graphic indicator on the PDM’s display
7. The filename of the downloadable electronic file created by the PDM for each respirable dust sample contains the ____________.
   a. PDM’s serial number and the date the sample was taken
   b. last name and first name of the miner wearing the PDM
   c. mine name and location
   d. MSHA district office number

8. A ____________ is used to program the PDM.
   a. digital oscilloscope
   b. electronic tachometer
   c. personal computer
   d. telephone

9. To program the PDM and to download sample results the CPDM must be connected to a ____________.
   a. power outlet and a flow meter
   b. PDM charger and personal computer
   c. flash drive and PDM charger
   d. recorder by a connecting cable

10. The respirable dust concentrations displayed on the PDM’s top panel are reported in ____________.
    a. micrograms per cubic meter (µg/m³)
    b. grams per cubic meter (g/m³)
    c. milligrams per cubic meter (mg/m³)
    d. ounces per cubic foot (oz/ft³)

11. During the time the sample is being taken, the ________ value displayed on the PDM’s top panel is always the cumulative dust concentration measured from the time the sampling shift started.
    a. Cum2 CONC
    b. Cum1 CONC
    c. 15 min
    d. 30 min

12. The Cum1 CONC recorded in the sample results stored in the downloadable sample file is updated ____________.
    a. once a day
    b. once a shift
    c. once a minute
    d. none of the above
13. The PDM must operate ___________ before the bar graph of concentration results is available for viewing.
   a. 10 minutes
   b. 20 minutes
   c. 30 minutes
   d. 40 minutes

14. To maintain certification to collect respirable coal mine dust samples using a CPDM, the certified person must pass an MSHA examination __________.
   a. every 2 years
   b. every 3 years
   c. every 5 years
   d. only once

15. When programming the PDM to take a respirable dust sample, the serial number of the PDM will first appear __________.
   a. after programming is completed
   b. in the upper right-hand corner of the screen before any information is entered
   c. blinking in all programming software screens
   d. none of the above

16. On the PDM COM1 screen of the PDM programming software, after the “Program Shift” button is activated, the certified person programming the PDM sample must enter ____________.
   a. start time of shift
   b. duration of shift
   c. mine ID number
   d. all of the above

17. When programming the PDM, the Shift Concentration Limit entered should be the applicable standard for the ______ being sampled.
   a. mine
   b. entity (DO, ODO, DA, DWP, part 90)
   c. individual miner
   d. equipment

18. A blinking “S” located in the upper right corner of the PDM’s top panel display indicates ____________.
   a. a sampling status condition has voided the sample
   b. any sample status conditions logged during the sample run
   c. the PDM is broken and the sample must be aborted
   d. the sound is turned off
19. MSHA will evaluate any status codes for the purpose of determining __________.
   a. what the age of the miner is
   b. how long the miner performed the job
   c. if the sample is valid
   d. if the ventilation quantity was as specified in the plan

20. Beginning February 1, 2016, ________ valid representative samples are required to be collected from each part 90 miner each calendar quarter when using a CPDM.
   a. 1
   b. 5
   c. 15
   d. 7

21. Beginning February 1, 2016, ___________ valid representative samples collected on consecutive normal production shifts are required from each DO and ODO every calendar quarter.
   a. 5
   b. 3
   c. 15
   d. 6

22. When a certified person programs the PDM the values entered for the temperature range need to be __________.
   a. at a tolerance no more than ± 0.1°C
   b. the average expected temperature
   c. precise
   d. based on the average of the last 30 days

23. In the event that a PDM fails the pre-operational check during the pre-shift warm-up period and the operator cannot use another PDM for sampling, the mine operator should notify the District Manager __________ that sampling will not occur because a PDM is not available.
   a. orally and in writing
   b. by text message
   c. by social media
   d. at the end of the quarter

24. The PDM by default will automatically report dust concentrations as a __________.
   a. MRE-Equivalent
   b. constant value
   c. maximum concentration
   d. minimum concentration
25. When the PDM recognizes a status condition is present the system
   _____________.
   a. shuts down immediately
   b. flashes red on the display screen
   c. creates and stores a sampling status code
   d. reverses the airflow through the pump

26. On August 1, 2016, the respirable dust standard for a part 90 miner will be
   ______ (mg/m³).
   a. 1.0
   b. 0.5
   c. 1.5
   d. 0.1

27. ECV is an acronym for _____________.
   a. excess constricted volume
   b. excess citation value
   c. excessive concentration value
   d. extra constrained variable

28. ____________ demonstrates noncompliance with the applicable respirable dust
   standard based on quarterly sampling by the operator.
   a. Two or more samples out of 5 samples ≥ ECV
   b. Three or more samples out of 15 samples ≥ ECV
   c. The average for all samples ≥ ECV (average for 5 or 15 samples)
   d. All of the above.

29. The ____ accounts for the margin of error between the true dust concentration
    measurement and the observed dust concentration measurement.
    a. reduced standard
    b. ECV
    c. MRE
    d. all of the above

30. A CPDM must be programmed to automatically report end-of-shift concentration
    measurements as MRE-Equivalent concentrations of ________.
    a. respirable coal mine dust
    b. moisture content
    c. coal dust
    d. quartz
31. A normal production shift is one on which the material produced by an MMU is at least equal to ______ percent of the average production recorded by the operator for the most recent 30 production shifts or for all production shifts if fewer than 30 shifts of production data are available.
   a. 50  
   b. 80  
   c. 100 
   d. 90 

32. A normal production shift for an MMU is based on the __________.
   a. 5 highest and 5 lowest production shifts  
   b. Average of the most recent 30 production shifts or all production shifts if fewer than 30 production shifts are available  
   c. 25 shifts of MMUs of equal size  
   d. average production on the last quarter sampled shifts

33. The ODO identification is a ______ digit number assigned by MSHA.
   a. 2  
   b. 3  
   c. 4  
   d. 7

34. The reduced standard for a MMU is determined by __________.
   a. EPA  
   b. OSHA  
   c. MSHA  
   d. NIOSH

35. A Designated Area (DA) will be assigned a ______ digit identification number by MSHA.
   a. 3  
   b. 4  
   c. 2  
   d. 7

36. A representative Designated Area (DA) sample, unlike a representative Designated Occupational (DO) sample, is not based on ________.
   a. the amount of material produced  
   b. the task performed by miners  
   c. the type of face ventilation  
   d. none of the above
37. A CPDM is approved by the Secretary of Labor and the Secretary of Health and Human Services (HHS) to ___________.
   a. collect respirable coal mine dust samples
   b. establish quartz percentages
   c. control coal production
   d. record what miners say

38. The CPDM results must be transmitted to MSHA __________.
   a. physically
   b. electronically
   c. by messenger
   d. only when requested by the District Manager

39. __________ is the effective date of the 1.5 mg/m³ respirable dust standard for the average concentration of respirable dust in the mine atmosphere.
   a. February 1, 2016
   b. August 1, 2016
   c. September 1, 2016
   d. none of the above

40. The intake air for an MMU must be continuously maintained at or below the intake air standard within _______ outby the working faces of each section.
   a. 100 feet
   b. 200 feet
   c. intake entry
   d. the mine

41. The maximum concentration of quartz that a miner may be exposed is ____________.
   a. 100 µg/m³
   b. 1.5 mg/m³
   c. 2.0 mg/m³
   d. 50 µg/m³

42. A reduced respirable dust standard due to the presence of quartz is determined by dividing the number _______ by the percent quartz.
   a. 10
   b. 1.5
   c. 2.0
   d. 20
43. Effective August 1, 2016, the 2.0 mg/m³ respirable dust standard will be lowered to __________ mg/m³.
   a. 1.0
   b. 0.5
   c. 1.75
   d. 1.5

44. ______ is the effective date that DOs (Designated Occupations) in each MMU must be sampled quarterly with an approved CPDM unless notified by the Secretary to continue to use an approved CMDPSU to conduct quarterly sampling.
   a. February 1, 2016
   b. August 1, 2016
   c. September 1, 2016
   d. none of the above

45. ______ assigns the four-digit identification number that identifies each Other Designated Occupation (ODO) that is required to be sampled on a MMU.
   a. MSHA
   b. A person certified in sampling using the CPDM
   c. The safety department
   d. The mine operator

46. Operators must sample each DO and ODO each calendar quarter until ________ valid representative samples are collected for each.
   a. 5
   b. 30
   c. 15
   d. 1

47. A sample can be ______ by MSHA only.
   a. changed
   b. corrected
   c. voided
   d. erased

48. When sampling shifts are longer than 12 hours, the CPDM must be switched out with a fully charged device prior to the _____ hour of operation.
   a. 13\textsuperscript{th}
   b. 8\textsuperscript{th}
   c. 10\textsuperscript{th}
   d. none of the above
49. The miners who will wear a CPDM must be provided training on basic features and capabilities of the CPDM prior to wearing a CPDM and then every ________ months thereafter.
   a. 6
   b. 12
   c. 24
   d. 36

50. Within ________ hours before the start of the shift on which a CPDM will be used to collect respirable dust samples, the CPDM must be checked to assure operational readiness by a certified person in sampling using the CPDM or maintenance and calibration for the CPDM.
   a. 0.5
   b. 3
   c. 1
   d. 2

51. Procedures to assure the operational readiness of a CPDM as recommended by the manufacturer must be performed by a ________.
   a. person certified in sampling using the CPDM
   b. person certified in maintenance and calibration for the CPDM
   c. either a or b
   d. none of the above

52. When sampling using a CPDM, the person certified in sampling must monitor the dust concentrations and the sampling status conditions being reported by the sampling device ______ or more frequently as specified in the approved mine ventilation plan.
   a. at the end of the cut
   b. between the 1st and 2nd hour of the shift
   c. at mid-shift
   d. during the last hour of the shift

53. Monitoring of a CPDM sample during the sampling shift is to assure ________.
   a. the device is in the proper location
   b. the device is operating properly
   c. the work environment of the sampled entity remains in compliance with the applicable standard at the end of the shift.
   d. all of the above

54. Sampling of each ODO on an MMU with a CPDM must begin after ______ the requirement for DO sampling on the MMU.
   a. starting
   b. fulfilling
   c. attempting
   d. all of the above
55. When required to sample more than one ODO type, each ODO type must be sampled over ________ time periods during the calendar quarter.
   a. separate
   b. the same
   c. several
   d. separate monthly

56. When programming the CPDM, the “shift concentration limit” is the ____________.
   a. excessive concentration value
   b. double the respirable dust standard
   c. applicable respirable dust standard
   d. average value

57. Upon notification by MSHA that the dust standard has changed for an MMU, the new standard shall become effective ___ calendar days after the date of notification.
   a. 8
   b. 7
   c. 15
   d. none of the above

58. If normal production is not achieved while sampling the DO or ODO with a CPDM, the sample file must be __________.
   a. downloaded to a personal computer and deleted
   b. transmitted to MSHA within 24 hours after the end of the sampling shift
   c. left stored on the CPDM until MSHA calls and asks for it
   d. none of the above

59. All CPDM data files transmitted electronically to MSHA shall be maintained by the operator for at least ____ months.
   a. 12
   b. 24
   c. 3
   d. 6

60. After a CPDM sample has been taken, a person certified in sampling shall validate, certify, and transmit the sample file electronically to MSHA within ____ hours.
   a. 12
   b. 24
   c. 36
   d. 8
61. The CPDM electronic sample data file must not be ______________.
   a. altered
   b. electronically transmitted
   c. downloaded
   d. viewed by mine operator

62. The operator shall keep a record of the miner’s training on the CPDM at the mine site for _____ months after completion of training.
   a. 12
   b. 24
   c. 36
   d. 6

63. The operator’s CPDM training record shall include _________________.
   a. date of training
   b. name of miner trained
   c. subjects included in the training
   d. all of the above

64. When using a CPDM a paper record (Dust Data Card) printed and posted on the mine bulletin board (except part 90 miners) and shall include the
   _________________.
   a. mine identification number
   b. location within the mine from which the sample was taken
   c. equivalent concentration reported and stored for the sample
   d. all of the above

65. The CPDM paper record (Dust Data Card) posted on the mine bulletin board shall include sampling status conditions encountered for each sample unless _________________.
   a. no sampling status conditions were encountered by the CPDM
   b. the status condition could not be explained
   c. the status condition was a repeat from the last time
   d. none of the above

66. MSHA will provide the operator with a report on the CPDM respirable dust samples that were electronically transmitted. Upon receipt, the operator must post this data on the mine bulletin board for at least ________ days.
   a. 2
   b. 31
   c. 15
   d. 60
67. Except for part 90 Miners, the CPDM paper record (Dust Data Card) posted on the mine bulletin board following sampling shall remain posted until ________.
   a. the MSHA report covering these respirable dust samples is received
   b. all samples are taken for the month
   c. the miner request that the information be updated
   d. the last day of the month

68. All samples are valid samples unless voided by ____________.
   a. a certified person
   b. a mine official
   c. MSHA
   d. all of the above

69. A designated work position (DWP) is a work position designated for sampling at ____________.
   a. surface coal mines and surface work areas of underground coal mines
   b. surface preparation plants only
   c. wet locations at surface work areas of an underground coal mine
   d. outby areas in underground coal mines

70. A DWP will be assigned a four-digit number by MSHA to identify the specific physical portion of the mine that is affected, followed by a three-digit MSHA coal mining ________ code describing the location to which a miner is assigned in the performance of his or her regular duties.
   a. occupation
   b. section
   c. MRE
   d. area

71. A respirable dust sample, submitted by electronic transmission to MSHA and then voided by MSHA, is not a _____ respirable dust sample.
   a. valid
   b. personal
   c. normal
   d. coal mine

72. When sampling a DWP the sampling unit shall remain with the DWP and be operational for _____.
   a. 8 hours
   b. the first half of the shift
   c. the entire shift
   d. none of the above
73. When sampling a DWP the sampling unit must be operating __________.
   a. while working in an active mining area
   b. while traveling to and from the DWP being sampled
   c. during the entire work shift
   d. all the above

74. Upon request from the District Manager the operator shall submit the date and
time that any required respirable dust sampling will begin. The information shall
be submitted at least ____ hours prior to the scheduled sampling.
   a. 24
   b. 48
   c. 72
   d. 8

75. MSHA requires respirable coal mine dust sampling with a CPDM to be performed by a __________.
   a. person certified by MSHA only in maintenance and calibration for the
      CPDM
   b. person familiar with MSHA sampling procedures
   c. person certified by MSHA in sampling with a CPDM
   d. mine official

76. MSHA may revoke a person’s certification to conduct respirable coal mine dust
sampling with a CPDM for __________.
   a. failure to properly carry out the required sampling procedures
   b. checking the CPDM at mid shift during sampling
   c. training the miner being sampled on how to start and stop a short term
      sample run during compliance sampling
   d. none of the above

77. If a normal work shift is not achieved when sampling a DWP with a CPDM, the
sample file must be _____.
   a. discarded and the reason recorded in the certified sampler’s notes
   b. transmitted to MSHA with a notation by the person certified in sampling
      stating that the sample was not taken on a normal work shift
   c. re-sampled the next shift even though it is raining
   d. printed and compared to the last sample taken

78. When sampling a DWP assigned to a piece of mobile equipment, the sampling
unit must be worn by the equipment operator or ____________.
   a. worn by the certified sampler
   b. the sampling shall be voided
   c. placed within 36 inches of the equipment operator’s normal working
      position.
   d. the shift supervisor
79. The DWP sample location may be changed by the ____________.
   a. District Manager
   b. Mine Superintendent
   c. equipment operator
   d. MSHA inspector

80. If a valid representative sample taken from a DWP exceeds the applicable standard, the operator shall, within ____ calendar days of notification, sample the DWP each normal work shift until five valid representative samples are taken.
   a. 5
   b. 10
   c. 15
   d. none of the above

81. Following receipt of notification from MSHA that a valid representative DWP sample has exceeded the applicable respirable dust standard, the operator shall begin sampling on the ____.
   a. first normal work shift
   b. second normal work shift
   c. next full month
   d. the next day shift

82. When a valid representative sample taken on a DWP meets or exceeds the _____, the operator shall immediately take corrective action to lower the concentration of respirable coal mine dust to at or below the applicable standard.
   a. applicable respirable dust standard
   b. excessive concentration value (ECV)
   c. national average concentration
   d. maximum allowed respirable dust

83. Noncompliance with the applicable standard for a DWP is demonstrated during the sampling period when ____ or more valid representative samples meet or exceed the ECV in Table 71–1 that corresponds to the applicable standard and the particular sampling device used.
   a. two
   b. three
   c. four
   d. five
84. Noncompliance with the applicable standard for a DWP is demonstrated when the _____ for all valid representative samples meets or exceeds the ECV in Table 71–2 that corresponds to the applicable standard and the particular sampling device used.
   a. highest
   b. lowest
   c. average
   d. both a and b

85. Upon issuance of a citation for a violation of the applicable standard, the operator shall begin sampling the environment of the affected DWP on consecutive normal work shifts within ____ calendar days after the date the citation is issued.
   a. 5
   b. 8
   c. 10
   d. 1

86. _____ valid representative sample(s) must be collected on a DWP upon issuance of a citation for a violation of the applicable standard.
   a. Five
   b. One
   c. Fifteen
   d. Thirty

87. When an MSHA sample collected on a nondesignated work position exceeds the applicable standard by ____% or more, a new DWP may be established by the District Manager.
   a. 30
   b. 75
   c. 50
   d. 80

88. Except for part 90 miner samples, within 12 hours after the end of each sampling shift using a CPDM, a person certified for such sampling shall print, sign, and post on the mine bulletin board a paper record including the ________.
   a. mine identification number
   b. shift length
   c. sampling status conditions encountered
   d. all of the above
89. A representative sample collected on a part 90 miner should reflect the typical dust concentration levels in the part 90 miner’s working environment while the miner performs ____________.
   a. normal work duties
   b. non production day duties
   c. work at an alternate site
   d. all of the above

90. As of August 1, 2016 the respirable dust concentration of a part 90 miner shall be at or below ____________.
   a. 1.0 mg/m³
   b. 0.05 mg/m³
   c. 0.5 mg/m³ or the applicable standard, whichever is less
   d. 0.5 µg/m³

91. Effective ______ 1, 2016 part 90 miners shall be sampled only with an approved continuous personal dust monitor (CPDM).
   a. January
   b. February
   c. August
   d. September

92. A person certified in sampling using a CPDM shall monitor the dust concentration and _______ at mid-shift or more frequently as specified in the approved ventilation plan when a CPDM is used to collect respirable coal mine dust samples.
   a. sampling status conditions
   b. radio channels
   c. cap light intensity
   d. none of the above

93. The operator shall take five valid representative dust samples for the part 90 miner within __________ days after the 20th calendar day following receipt of notification from MSHA that a part 90 miner is employed by the mine.
   a. 5
   b. 10
   c. 15
   d. 30

94. The operator shall take five valid representative dust samples collected on consecutive work days from the environment of each part 90 miner every ____________.
   a. month
   b. calendar quarter
   c. bimonthly period
   d. none of the
95. When a citation is issued for a violation of the applicable standard for a part 90 miner, the operator shall take immediate corrective action to lower the concentration of respirable dust to at or below the applicable standard. The operator shall begin sampling the affected miner to collect five valid representative samples within _____ calendar days after the date the citation is issued.
   a. 5
   b. 8
   c. 10
   d. 2

96. A citation for violation of the applicable standard for a part 90 miner shall be terminated by MSHA when the concentration of _____ of the five valid representative samples is at or below the applicable standard.
   a. 2
   b. 3
   c. each
   d. 4

97. Each part 90 miner sample submitted by the mine operator must include the part 90 miner’s _______ as the means to identify the miner.
   a. MIIN
   b. PIN
   c. RIN
   d. SSN

98. A person certified in sampling must provide each part 90 miner the respirable dust sample measurements downloaded from the CPDM ____________.
   a. within one day after all samples have been completed.
   b. within two days after all the samples have been completed.
   c. within one hour after the start of the part 90 miner’s next work shift.
   d. sometime during the sampled quarter

99. _______ is permitted to open the case of a PDM that will be used to collect respirable coal mine dust samples?
   a. Anyone
   b. A mine official
   c. A certified person in sampling using the CPDM
   d. A certified person in maintenance and calibration for the CPDM
100. The PDM 3700 should have a label affixed to the back of the instrument showing that the instrument is approved by ________.
   a. Underwriter Laboratories
   b. NIOSH/MSHA
   c. OSHA
   d. both a and b

101. The flow rate of a CPDM can be calibrated by following the manufacturer’s procedures. The person authorized to perform the procedures must be ________.
   a. certified by MSHA in low voltage power
   b. certified by MSHA in maintenance and calibration for the CPDM
   c. certified by MSHA as a mine foreman
   d. employed by the manufacturer

102. The PDM 3700 requires a warm-up period of ___________ that the instrument must cycle through before a programmed sample can begin.
   a. 15 minutes
   b. 25 minutes
   c. 35 minutes
   d. 40 minutes

103. The PDM 3700 must be started by ________ for collecting a full shift respirable coal mine dust sample.
   a. a manual start
   b. a programmed start
   c. pressing the on switch
   d. either a or c

104. The PDM 3700 shall not be charged in an environment below ________.
   a. 0°C (32° F)
   b. 32° C
   c. 60° F
   d. 0° F

105. If ________ the PDM 3700 shall not be operated.
   a. the conditions are very dusty
   b. working close to another operating PDM 3700
   c. the case is damaged or otherwise compromised
   d. water mist is in the air
106. The air that enters the PDM 3700 passes through a filter that is located
   __________.  
   a. in the air course one inch from the inlet opening  
   b. in the mass transducer unit  
   c. between the inlet and discharge of the sampling tube  
   d. inside the cyclone

107. The PDM 3700 should be charged at least _______ before performing a sampling run.
   a. 6 hours  
   b. 8 hours  
   c. 12 hours  
   d. 16 hours

108. As indicated on the front of the PDM charger, the PDM light on the charger is
       __________ when the PDM charge is complete.
       a. solid red  
       b. solid green  
       c. flashing green  
       d. flashing red

109. As indicated on the front of the PDM charger, the PDM light on the charger is
       __________ when the PDM has a charge greater than 80% but not complete.
       a. solid red  
       b. solid green  
       c. flashing green  
       d. flashing red

110. As indicated on the front of the PDM charger, the PDM light on the charger is
       __________ when there is a problem with the charger or connection.
       a. solid red  
       b. solid green  
       c. flashing green  
       d. flashing red

111. The PDM 3700 measures the amount of dust deposited on the units filter using the
    technology of a TEOM. TEOM stands for ___________.  
    a. Thermo Electronic Operating Meter  
    b. Tapered Element Oscillating Microbalance  
    c. Timed Evaluation Of Measurement  
    d. Thermal Element Oscillating Microbalance
112. The filter installed on the TEOM of the PDM 3700 is changed__________.
   a. after each shift of sampling  
   b. before the unit is charged  
   c. after the unit is charged  
   d. when the PDM sets a status code indicating a new filter is needed

113. The sample filter is placed on the _________ located in the TEOM unit of the PDM 3700.
   a. filter holder  
   b. tapered element  
   c. sample bracket  
   d. filter case

114. A __________ is furnished to change the filter in the PDM 3700.
   a. filter exchange tool  
   b. filter rotate tool  
   c. filter shifter tool  
   d. filter clamping tool

115. A sample run taken with the PDM 3700 can be started by two methods. The method of starting a sample run to be submitted to MSHA is _____________.
   a. manual  
   b. programmed  
   c. miner initiated  
   d. none of the above

116. When the PDM 3700 is warming up, the warming time displayed indicates __________.
   a. the time remaining before the sample will begin  
   b. the time warm up began  
   c. the time of day  
   d. the remaining life of the heating element

117. After the PDM 3700 has been started using the WinPDM software (programmed start), the measurement of the displayed CUM1 CONC begins _____________.
   a. automatically when the warm up time ends  
   b. when the mass on the filter reaches 0.1 milligrams  
   c. 30 minutes after the shift starts  
   d. when the miner presses the start button

118. During a programmed run, the PDM 3700 unit will display the measurement of ________________.
   a. CUM A, CUM B, CUM C  
   b. 30 MIN CONC, CUM1CONC  
   c. REC X, REC Y, REC Z  
   d. none of the above
119. A bar graph of average concentrations during the primary sample is displayed by pushing the combinations of the (A) and (B) buttons on the top of the PDM 3700. Each bar of the graph represents _________.
   a. 10 minutes  
   b. 15 minutes  
   c. 30 minutes  
   d. 40 minutes

120. The PDM 3700 bar graph can tell the miner ___________.
   a. if respirable dust exposures were higher before or after mid-shift  
   b. the approximate time of exposure to the greatest concentrations during sample  
   c. the approximate time of the lowest exposure  
   d. all the above

121. If a CPDM is found to have a __________ during the pre-shift check, then the CPDM cannot be used for sampling in a coal mine.
   a. cracked case  
   b. missing screw  
   c. missing or illegible approval label  
   d. all of the above

122. Within ______ before the start of the shift to be sampled a certified person in sampling using the CPDM or in maintenance and calibration for the CPDM will assure the operational readiness of the CPDM.
   a. 30 minutes  
   b. 1 hour  
   c. 2 hours  
   d. 3 hours

123. When placing the PDM 3700 inlet on a miner, the inlet assembly should be attached to the miner’s ________ within the miner’s normal breathing zone, making sure the inlet is not obstructed.
   a. chest  
   b. head  
   c. waist  
   d. hard hat

124. The monthly flow audit for the PDM 3700 can be performed by ___________.
   a. a person certified in sampling using CPDM  
   b. a person certified in maintenance and calibration for the CPDM  
   c. anyone that knows how to perform the check  
   d. both a. and b.
125. __________ can require additional groups of 15 valid representative DO samples in an MMU if information indicates that the operator has not followed the approved ventilation plan.
   a. The District Health Supervisor
   b. An MSHA inspector
   c. The District Manager
   d. None of the above

126. If a flow audit determines the PDM is not operating at the 2.2 liter per minute flow rate, __________ is permitted to perform a flow calibration.
   a. a person certified in sampling for using the CPDM
   b. a person certified in maintenance and calibration for the CPDM
   c. anyone that knows how to perform the task
   d. both a. and b.

127. Unless otherwise directed by the District Manager, the sample inlet assembly must be located ________________ and free of obstructions such as a coat covering the inlet.
   a. on the piece of mining equipment
   b. on the miner required to be sampled
   c. in the return airway
   d. within 10 feet of the face
